Google LLC — Data Scientist

Role Category: Data Scientist

Bengaluru, India · Full-Time · ₹28,00,000 CTC Annual performance bonus and stock grants

Role Overview

Analyze massive datasets to extract insights, build predictive models, and support product and business decisions. You'll work closely with engineering and product teams to design experiments, evaluate metrics, and deploy data-driven solutions.

Key Responsibilities

Design and run experiments (A/B tests) and interpret their results rigorously

Write efficient, production-grade SQL against very large datasets, including schema design and query optimization

Build and evaluate predictive models, applying sound statistical judgment

Partner with engineering and product teams to turn analysis into shipped features

Present findings clearly to both technical and non-technical stakeholders

What We're Looking For

Strong SQL skills — writing and optimizing complex queries, understanding indexing, and designing a schema for event or telemetry data

Solid quantitative and analytical reasoning — comfortable interpreting experiment results, probability, and metrics under ambiguity

Foundational machine learning knowledge: bias-variance tradeoff, regression vs. classification, how gradient descent works, and how to recognize overfitting

Excellent communication skills — able to explain a complex model or a surprising result to a product manager in plain language, and defend assumptions when challenged

A track record, academic or applied, of turning a messy dataset into a clear, defensible insight

Nice to Have

Experience with a BI/visualization tool; exposure to experimentation platforms; a portfolio of applied data projects.

Benefits

Health coverage, paid parental leave, learning programs, RSUs, flexible work arrangements.
