Microsoft Corporation — Data Analyst

Role Category: Data Analyst

Hyderabad, India · Full-Time · ₹18,00,000 CTC Annual performance bonus and stock awards

Role Overview

We're looking for a Data Analyst to turn product and business data into decisions. You'll build dashboards, define metrics, and work directly with stakeholders across Microsoft.

Key Responsibilities

Write and optimize SQL queries against large production datasets

Design schemas for telemetry and usage data, and know when to normalize vs. denormalize

Build dashboards and reporting that stakeholders actually use

Detect and explain anomalies in usage or business metrics

Communicate insights clearly to non-technical stakeholders and defend your methodology

What We're Looking For

Strong, practical SQL — from a simple monthly-active-user query to schema design and index-aware query optimization

Solid quantitative reasoning — interpreting trends, sampling, probability, and reasoning with data tables under ambiguity

Basic applied statistics/ML literacy: regression vs. classification, what overfitting means, and how to sanity-check a model's output

Excellent stakeholder communication — translating a dashboard or an analysis into a decision a non-technical leader can act on

Comfort with ambiguous or incomplete requirements, and the initiative to clarify them

Nice to Have

Experience with a visualization tool (Power BI or similar); a portfolio of dashboards or analyses; prior internship in an analytics role.

Benefits

Health coverage, RSUs, flexible work options, learning programs, paid leave.
