Oracle Financial Services Software Limited — Application Support Analyst

Role Category: Support / Operations

Bengaluru / Chennai, India · Full-Time · ₹4,50,000 CTC Shift allowance and annual performance bonus

Role Overview

Provide L2/L3 application support for Oracle Financial Services products used by global banking clients — a support and troubleshooting role with real client-facing responsibility, not a pure development role.

Key Responsibilities

Triage, investigate, and resolve incidents raised by banking clients within SLA

Query production databases to diagnose issues

Coordinate with development teams on escalations that require a code fix

Monitor logs and batch/real-time processes to catch issues early

Communicate clearly and calmly with clients during incidents

What We're Looking For

Comfort with basic SQL — simple SELECT/WHERE queries and an understanding of primary keys

Operating systems and Linux fundamentals — basic command-line usage, what a log file is, batch vs. real-time processing

Basic networking knowledge — what an IP address is, client-server architecture fundamentals, and what “latency” means in practice

Strong quantitative and logical reasoning — data interpretation from tables, arithmetic, and structured problem-solving

Excellent communication skills — able to explain a technical issue to a non-technical client, stay calm during an escalation, and document what happened clearly

Willingness to work in shifts and directly support global clients

Nice to Have

Prior exposure to a ticketing/incident system; coursework in networking or systems administration.

Benefits

Medical insurance, night shift allowance, transport facility, paid leaves.
